NVR5.0 Setup

By default DeepVision/Direct Search is enabled on the NVR.

Browser Setup

Navigate to Event Center on the left side menu bar.

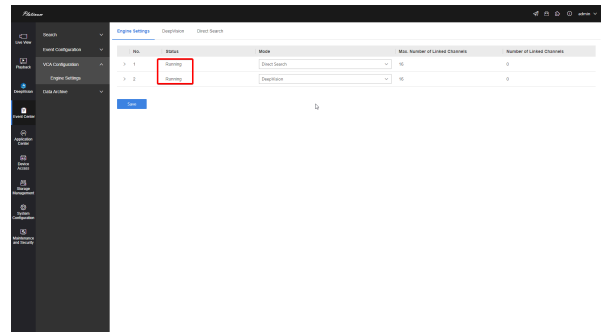

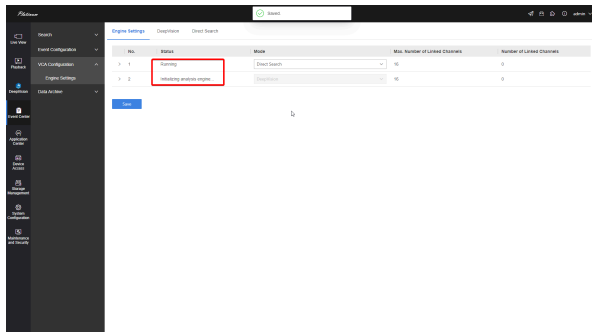

Change the Engine Mode 1 from "Unloaded" to "Direct Search", Engine Mode 2 from "Unloaded" to "DeepVision", afterwards click save.

The screenshot shows the NVR5.0 web interface. On the left sidebar, the 'Event Center' menu item is highlighted. The main content area displays the 'Engine Settings' configuration page. A table lists two engine modes:

No.	Status	Mode	Max. Number of Linked Channels	Number of Linked Channels
1	Running	Direct Search	16	3
2	Running	DeepVision	16	3

Red annotations in the image include a box around 'Engine Settings' in the top navigation bar, a box around 'VCA Configuration' in the left sidebar, and boxes around the 'Mode' dropdowns for both engine entries. Red arrows point from these annotations to the corresponding elements in the table.

The status will change from "Initializing analysis engine..." to "In progress". The page will not auto update the status, manually refresh the page or change to a different tab and return to confirm that the status is updated.

Afterward, go to the "Direct Search" tab, toggle the Enable slider, check all cameras that are to do direct search, and finally click "Save". Repeat these steps in the DeepVision tab.
