Warning

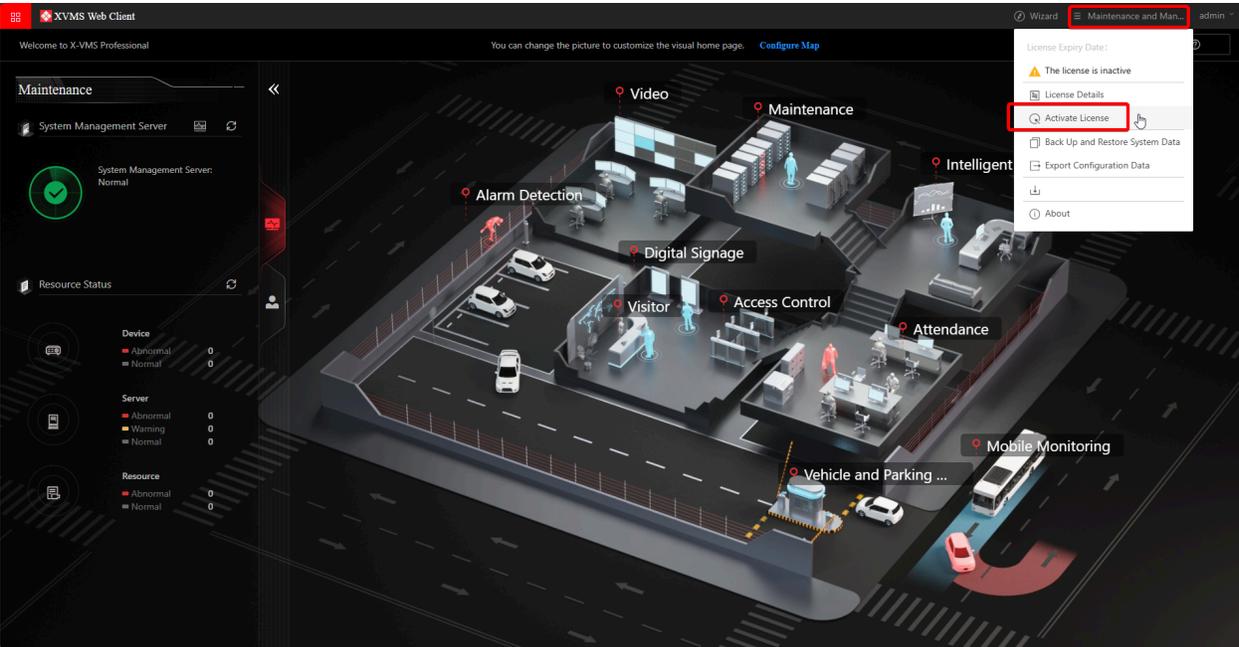

The licenses are bound to the computer/server after activation. Please keep backups of the server such as through imaging. If backups were not made and the server is lost in any way, the licenses are **NOT RECOVERABLE**.

If at any point, there is a need to change or replace the server, deactivate the license first before decommissioning.

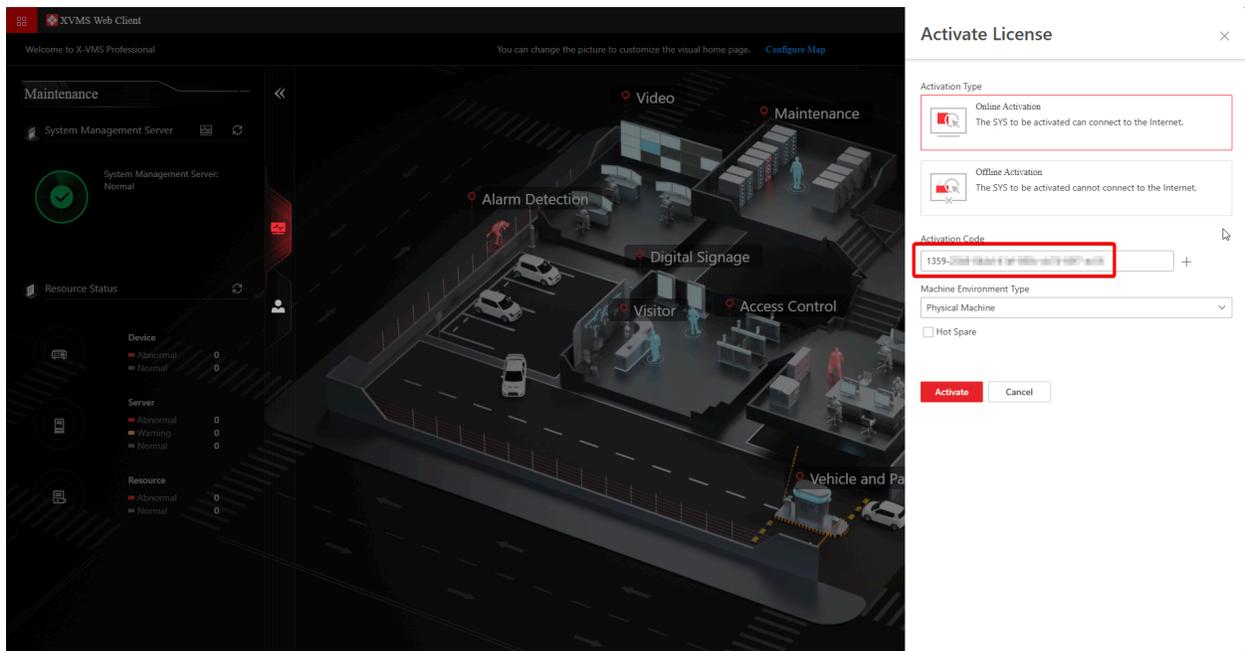

Activation

This activation can ONLY be done from the browser.

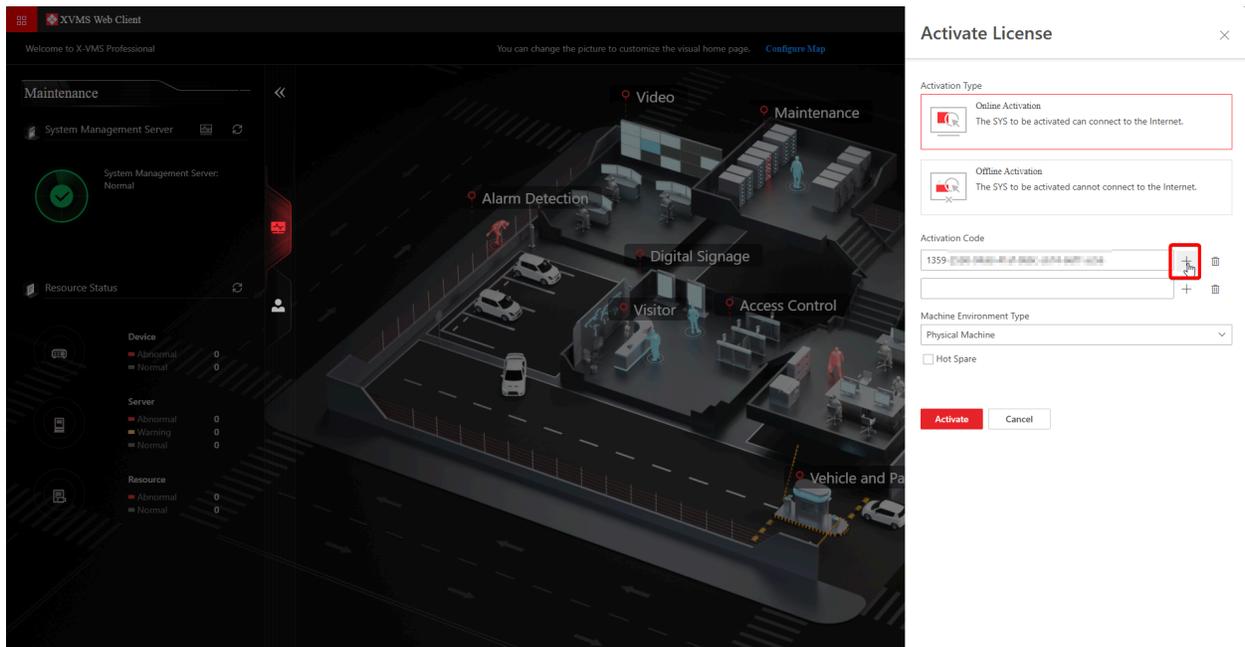

Login through the browser, mouse over Maintenance and Management in the top right, then click Activate License.

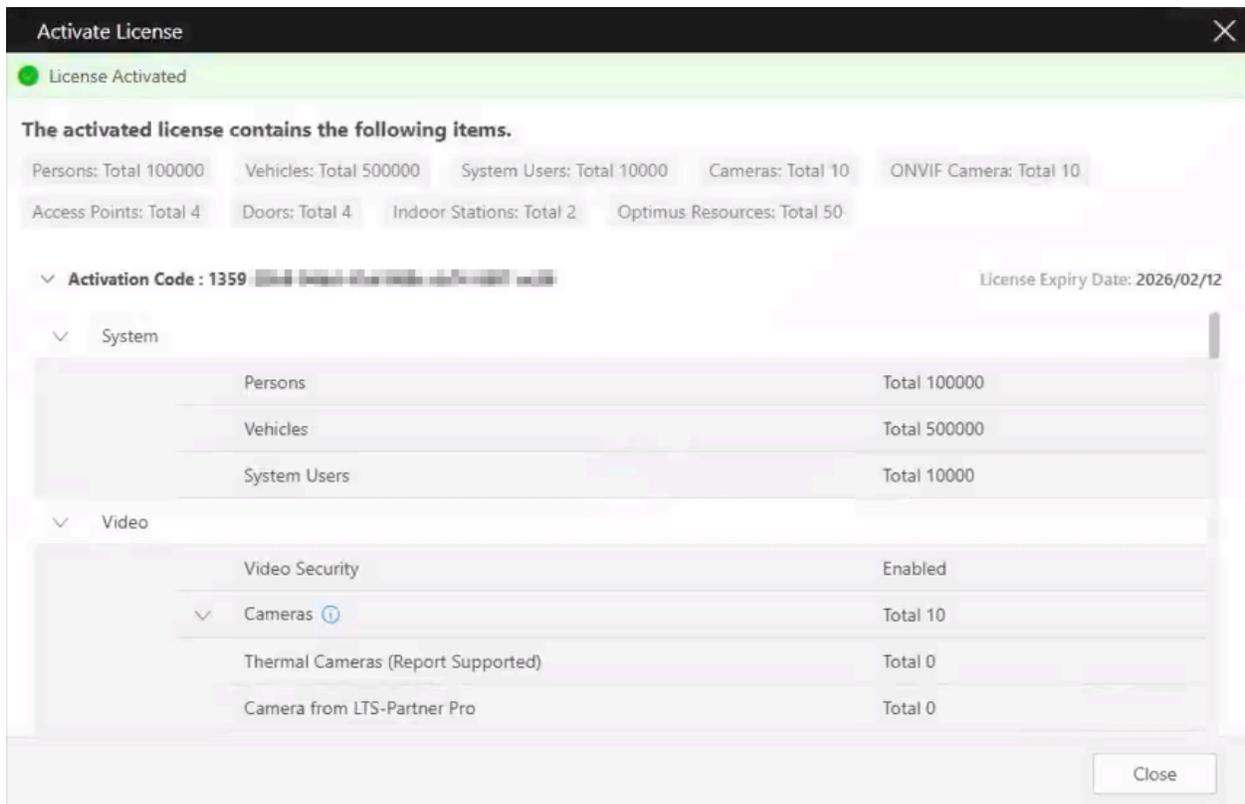

A menu will appear on the right hand side. Type or paste in the X-VMS license into the field.

If there are multiple licenses, click the + symbol to the right of the field to get more fields.

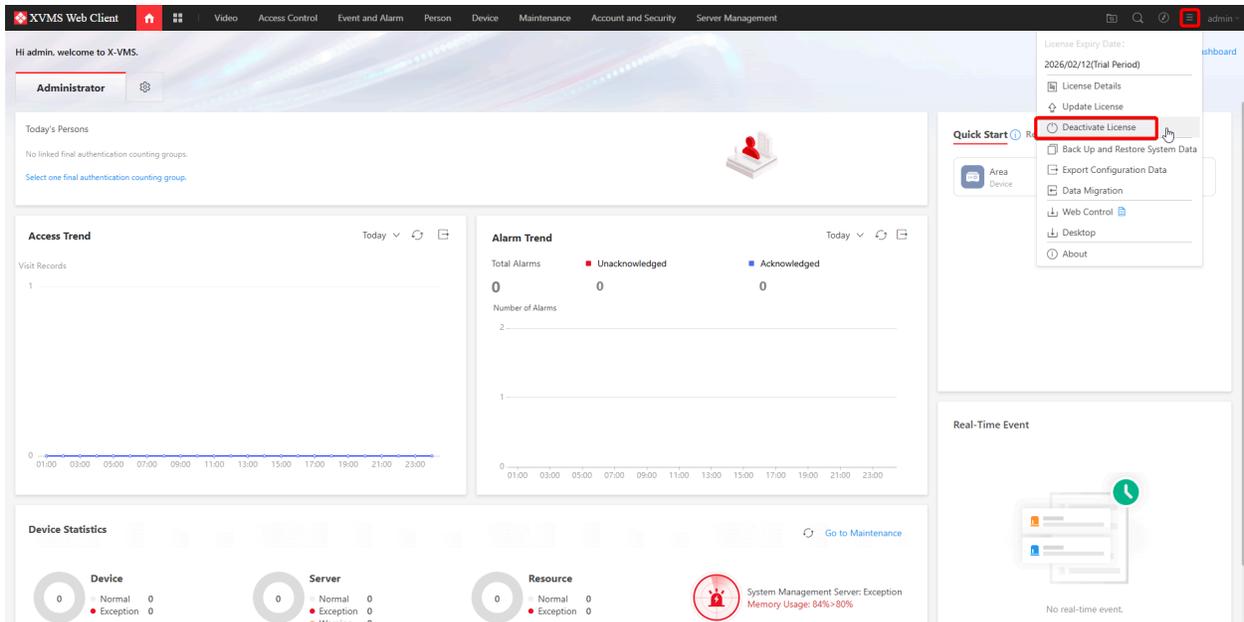

Click activate after having input all licenses. Assuming no errors, a pop up will show the capabilities given by the licenses activated.

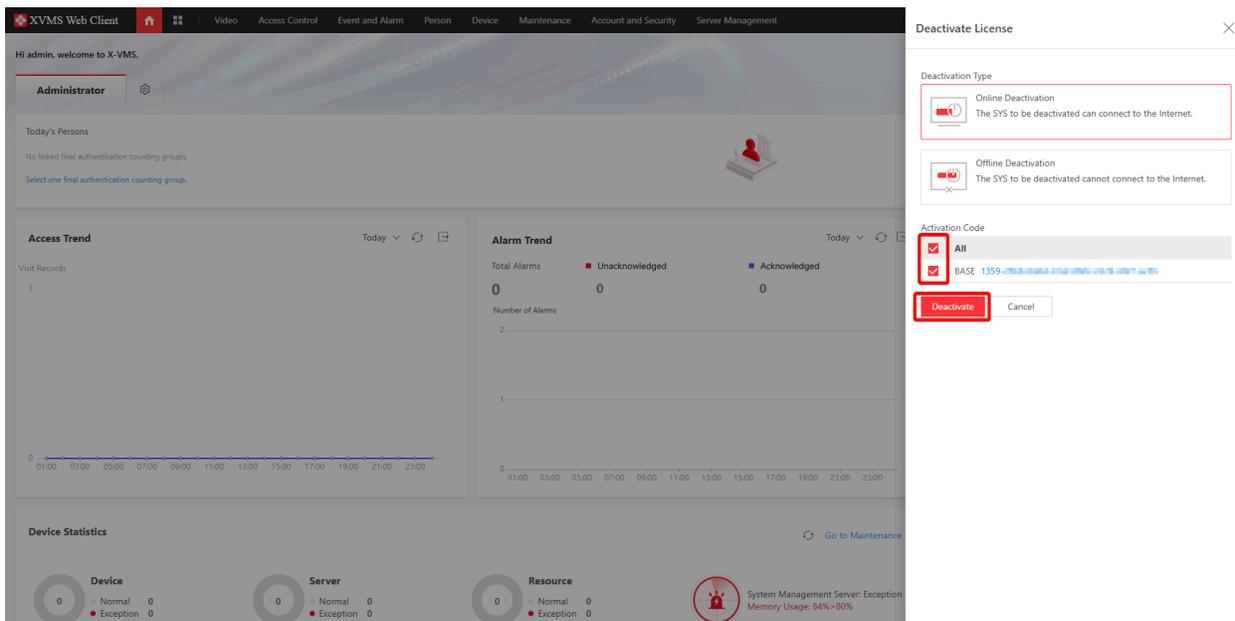

Deactivation

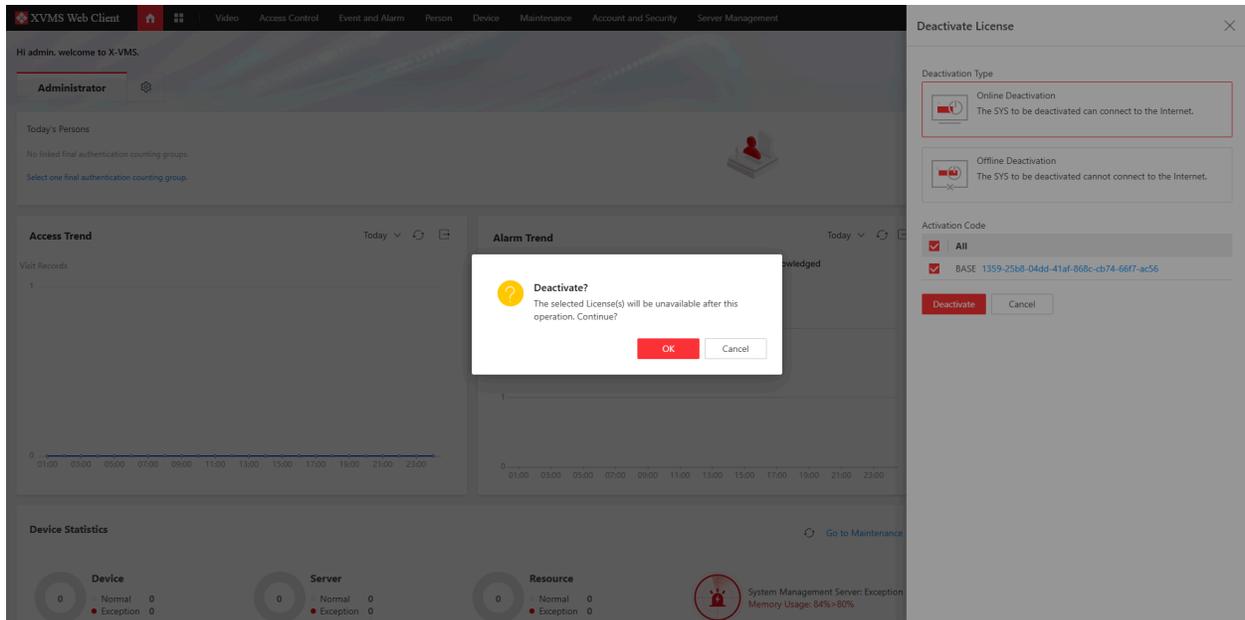

In the browser, mouse over the hamburger icon in the top right and then click "Deactivate License".

In the menu that appears on the right side, check the licenses that are to be deactivated and then click "Deactivate" below.

A warning will appear stating that the licenses will be deactivated. Confirm by clicking "OK".

The system will finally finish deactivating the licenses, at which point if the server needs to be decommissioned, it can be taken offline without any issues.
